

User Story 1

One of our user stories will be the login and logout process. The user will use their gmail to login to our app. There will be a login link pop up that will tell the user to input their gmail credentials (i.e email and password) and whether they'd like to stay signed in. If the user doesn't have a gmail account then they'll be directed to create an account using our application. There they'll be directed to input an email, password, and two security questions. Once they've created an account they'll be sent an email to confirm the account. Once that's done they'll input the login information they entered before. If they have a gmail account they'll be asked whether or not they'd like to link other google info tied to their account (i.e google calendar, google maps, etc.) If they made an account using our application then they won't be asked this. They'll instead be asked if they'd like to input any necessary info themselves, which we'll save locally to their account. For example, they could input their home address to save for future use, as well as, input any important calendar events to prevent any conflict with any of them during their trip. Once they decide to logout, all they'll have to do is click on "sign out" and all their info will still be saved for when they log back in. Whether that be using gmail or the application's account they created.
