

User Story 4 - locations to eat

As a user attempting to also receive a map that highlights locations to eat along the route will check a field that states the user wants to also receive restaurant preferences. This will prompt a dropdown menu that will tell me to list my specifications such as budget, meals per day, time between meals, type of food, etc. After I fill this information out I will be returned with potential restaurants along the route according to my preferences. If restaurants are not available along the route, I will be given a message that recommends a different potential route or different potential restaurant to time preference.
